2 USMLE Road Map para Anatomía

- a. Los **músculos grandes**, como el cuádriceps femoral y el glúteo mayor, producen movimientos gruesos y consisten de unidades motoras grandes.
- b. Los **músculos pequeños**, como los músculos intrínsecos de la mano, permiten movimientos finos y poseen unidades motoras pequeñas.
4. El músculo esquelético se inserta en la **unión neuromuscular**, que es el sitio donde el axón de una neurona motora hace sinapsis con la placa terminal de una fibra muscular (Fig. 1-1).
5. La **acetilcolina** que libera la terminal del axón se fija a los receptores colinérgicos (canales de iones) situados en la membrana de la placa terminal. La abertura de estos canales permite la entrada de iones de sodio, que despolarizan a la membrana muscular.

MIASTENIA GRAVE (FIG. 1-1)

En la **miastenia grave**, los anticuerpos del propio organismo atacan a los receptores de acetilcolina y dan lugar a una transmisión neuromuscular deficiente.

- El trastorno afecta en particular a los **músculos que inervan los pares craneales**, los más de los veces a los músculos oculares. La debilidad se acentúa con el uso.
- Estos pacientes muestran ptosis bilateral y diplopía horizontal, acompañadas en ocasiones por dilatación de la pupila, debilidad para la masticación y lentitud de los músculos de la expresión facial. Otras veces se afectan los músculos proximales de las extremidades. Casi nunca se comprometen los músculos cardíacos y lisos.
- Muchos sujetos con miastenia grave **padecen hipoplasia del timo o un timoma**.
